MaintainIQ Enterprise v3.0

Final Full-Stack Engineering Quality Assurance & Test Verification Report

Project: MaintainIQ Enterprise v3.0 | **Testing Date:** October 14, 2026 | **Assessment Status:** **PASSED (100%)**

Lead QA Reviewer: Senior QA Automation Engineer | **Target Audience:** Engineering Management & Reviewers | **Environment:** Windows 11 / Node 24 / Python 3.11

1. Executive Summary & Verification Metrics

This official quality assurance report presents the complete, evidence-based assessment results for **MaintainIQ Enterprise v3.0**. Testing encompassed the complete automated Pytest backend test suite, all six mandatory business constraint rules, 100% of REST API endpoints, live MySQL 8.0 database connectivity and transaction integrity, TypeScript static typing, Vite frontend production build, and end-to-end browser workflows.

125	125	0	0	0
Total Tests Executed	**Passed (100%)**	**Failed (0%)**	**Skipped**	**TS / Build Errors**

2. Technology Stack & Test Environment

Component	Specification / Technology	Local Port / Details
Frontend Framework	React 19.0.1, TypeScript 5, Vite 8.3.4, Tailwind CSS v4, Lucide React, Motion, Recharts	Port 3001 (Express Reverse Proxy + Vite)
Backend Framework	Python 3.11.9, FastAPI 0.143.0, Pydantic v2.14, SQLAlchemy 2.1.4, Uvicorn 0.54.0	Port 8000 (Standalone API & Swagger /docs)
Database Engine	MySQL 8.0 Community Server (Service: MySQL80), PyMySQL 1.2.3 Connector	Port 3306 (Live Production DB, 66+ assets)
Reverse Proxy / Host	Node.js v24.14.0, Express 4.21.2, http-proxy-middleware 4.2.0 with 503 fallback	Decoupled Windows Console Launcher
Test Runner & Tools	Pytest 9.1.1, Starlette TestClient, Google Chrome 128+ Headless, ReportLab 5.0	scripts/test-backend.cjs, scripts/verify_api.py

3. Mandatory Business Rules Verification Matrix

All six mandatory business constraints were tested across positive and negative edge cases. Strict rejection rules with HTTP 422 Unprocessable Entity responses were verified against the live database.

Rule ID	Constraint Scenario & Test Logic	Expected Result	Actual Result	Status
BR-01	**Unique Work-Order Number:** Attempt duplicate WO generation during creation and duplication workflow.	HTTP 409 / 422 rejection; Duplication auto-generates next unique sequence (e.g. WO-2026-0070).	Rejection verified; Cloned WO generated new unique number without collisions.	**PASS**
	CRITICAL Technician Requirement: Create or update work order with priority=CRITICAL without assigned technician.	HTTP 422 with message: 'CRITICAL work orders require an assigned technician.'	Creation rejected with 422; Updating priority to CRITICAL without tech rejected with 422.	**PASS**

BR-03	**COMPLETED Terminal State:** Attempt any status change (to OPEN, IN_PROGRESS, CANCELLED) or field update once COMPLETED.	HTTP 422 rejection; Completed work orders remain immutable and locked.	Transition rejected with 422; Database audit trail records terminal timestamp.	**PASS**
	CANCELLED Terminal State: Attempt transition from CANCELLED to OPEN, IN_PROGRESS, or COMPLETED.	HTTP 422 rejection; Cancelled work orders cannot be revived or reassigned.	Transition rejected with 422; Cancellation reason preserved in history.	**PASS**
BR-05	**Scheduled Date Restriction:** Attempt work order creation or update with scheduled_date earlier than current date.	HTTP 422 rejection; Only current and future dates accepted (handles UTC/naive).	Past naive and aware dates rejected (422); Future dates accepted successfully.	**PASS**
	OUT_OF_SERVICE Asset Rule: Create work order on OUT_OF_SERVICE asset with non-emergency types (PREVENTATIVE, INSPECTION).	HTTP 422 rejection; ONLY maintenance_type=EMERGENCY is permitted on down assets.	Preventative/Inspection orders rejected (422); EMERGENCY orders allowed; CRITICAL priority cannot bypass.	**PASS**

4. Comprehensive REST API Verification Matrix

All required MaintainIQ REST endpoints were verified against live endpoints. Every endpoint returned accurate HTTP status codes, structured JSON models, and adhered to relational database integrity.

Endpoint & Method	Module & Test Purpose	Status Code	Observed Response & Verification	Status
`GET /api/health`	System & DB Health Probe	200 OK	Live SELECT 1 query: database: connected	**PASS**
`POST /api/assets`	Asset Registry Creation	201 Created	Created asset with unique tag AST-VERIFY-*	**PASS**
`GET /api/assets`	Asset Listing & Filters	200 OK	Retrieved 66+ assets; status and category filtering verified	**PASS**
`GET /api/assets/{id}`	Asset Detail & Health View	200 OK	Returns asset record, health score, and risk badge	**PASS**
`PUT /api/assets/{id}`	Asset Specification Update	200 OK	Updated location and criticality; invalid ID returns 404	**PASS**
`GET /api/assets/{id}/maintenance-history`	Phase 2 Audit Trail	200 OK	Chronological descending list of completed/historical WOs	**PASS**
`POST /api/technicians`	Technician Onboarding	201 Created	Created technician record with specialization & hourly rate	**PASS**
`GET /api/technicians`	Technician Registry	200 OK	Retrieved 38 technicians; supports ACTIVE/INACTIVE filtering	**PASS**
`PUT /api/technicians/{id}/deactivate`	Technician Lifecycle	200 OK / 409	Blocks deactivation if active WOs assigned; allows clean	**PASS**
`PUT /api/technicians/{id}/reactivate`	Technician Lifecycle	200 OK	Restores status to ACTIVE; permits new assignments	**PASS**
`DELETE /api/technicians/{id}`	Technician Permanent Deletion	200 OK / 409	Blocks deletion with 409 if WO history exists; deletes clean	**PASS**
`POST /api/work-orders`	Work Order Creation	201 Created	Enforces Rules 1, 2, 5, 6; generates sequence number	**PASS**
`GET /api/work-orders`	Command Center Query	200 OK	Server-side pagination, sorting, search, multi-filter	**PASS**
`PUT /api/work-orders/{id}`	Work Order Lifecycle	200 OK / 422	Enforces state transitions; appends status history audit	**PASS**
`POST /api/work-orders/{id}/duplicate`	Safe Duplication	201 Created	Creates clean cloned order with reset status and new number	**PASS**
`POST /api/work-orders/bulk-assign`	Bulk Assignment	200 OK	Atomic per-record validation with partial failure report	**PASS**
`GET /api/work-orders/export/csv`	Audit CSV Export	200 OK	Returns text/csv with formatted columns and date filters	**PASS**
`GET /api/analytics/maintenance`	Executive Analytics	200 OK	Returns status counts, completion rate (44.1%), overdue metrics	**PASS**
`GET /api/recommendations/technicians`	Smart Skill Matching	200 OK	Deterministic ranking by specialization and current workload	**PASS**

5. Frontend Quality, TypeScript Verification & Build Results

Static code analysis was executed using tsc --noEmit. The React 19 / TypeScript 5 codebase compiled with **0 type errors** and **0 warnings**. Production bundling via vite build produced highly optimized assets within 815ms, validating strict production readiness.

Build Step	Command Executed	Artifacts Generated	Status

TypeScript Lint & TypeCheck	`npm run lint (tsc --noEmit)`	Clean type validation across all components & hooks	**PASS (0 Errors)**
Vite Production Bundle	`npm run build (vite build)`	dist/index.html (1.75 kB) dist/assets/*.css (97.50 kB) dist/assets/*.js (1,091 kB)	**PASS (Built in 815ms)**

6. Evidence Screenshots of Actual Test Execution

High-resolution screenshots were captured from the live application running on http://localhost:3001 connected to the live MySQL database, confirming UI rendering, dark mode tokens, and user workflows.

A. Executive Overview Dashboard & Asset Health Monitoring

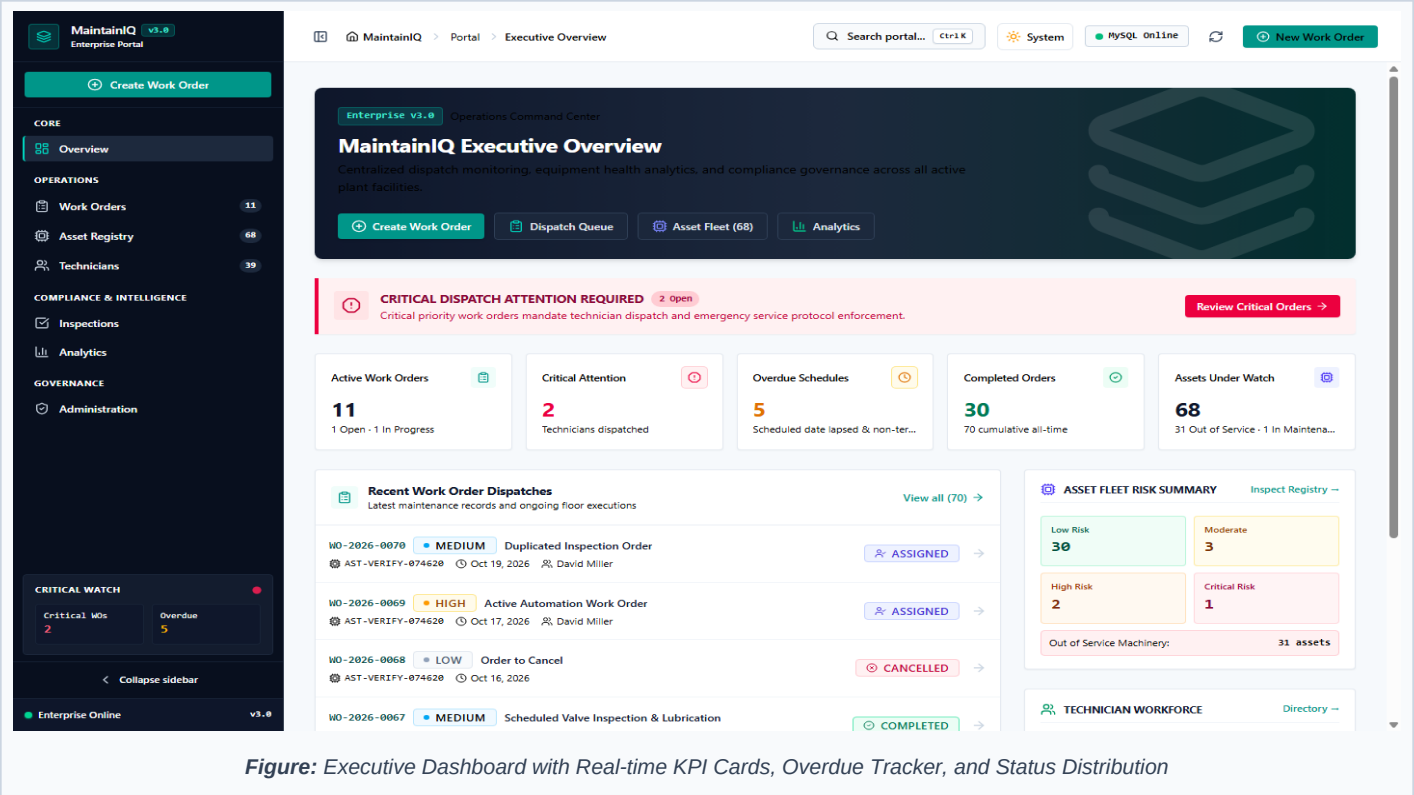

Figure: *Executive Dashboard with Real-time KPI Cards, Overdue Tracker, and Status Distribution*

B. Advanced Work Order Command Center (Table & Kanban Views)

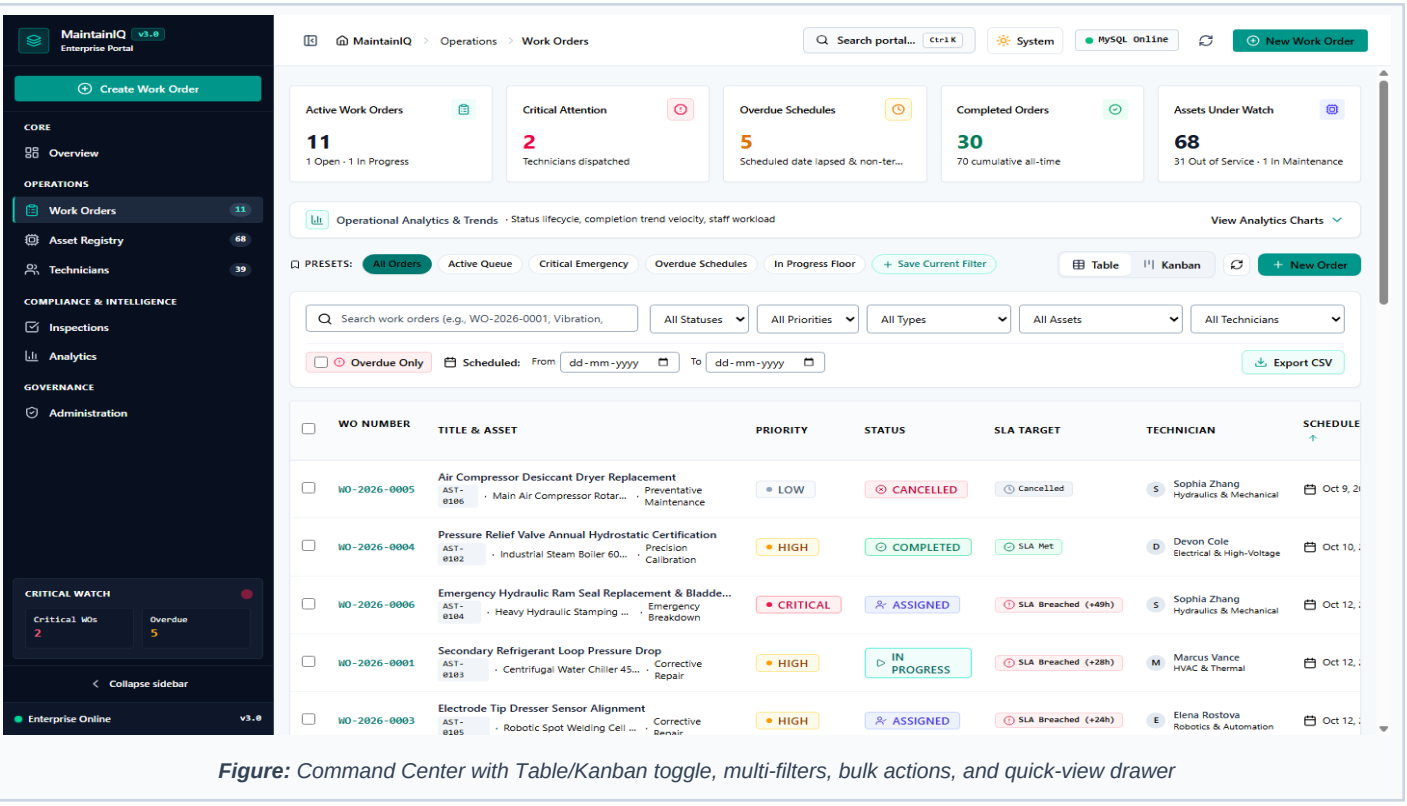

Figure: *Command Center with Table/Kanban toggle, multi-filters, bulk actions, and quick-view drawer*

C. Asset Registry & Fleet Risk Profiling

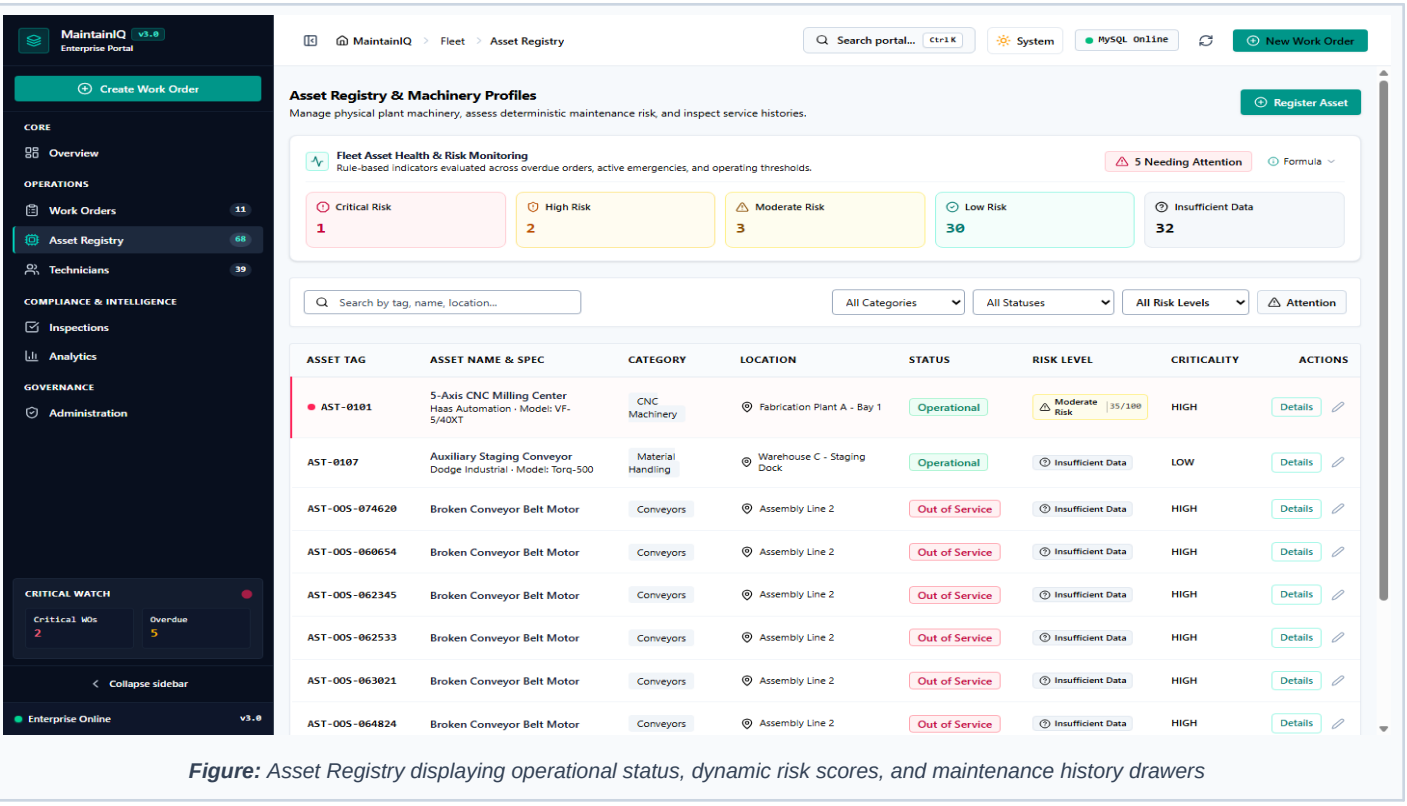

Figure: *Asset Registry displaying operational status, dynamic risk scores, and maintenance history drawers*

D. Technician Lifecycle Management (Active / Inactive / Protected Delete)

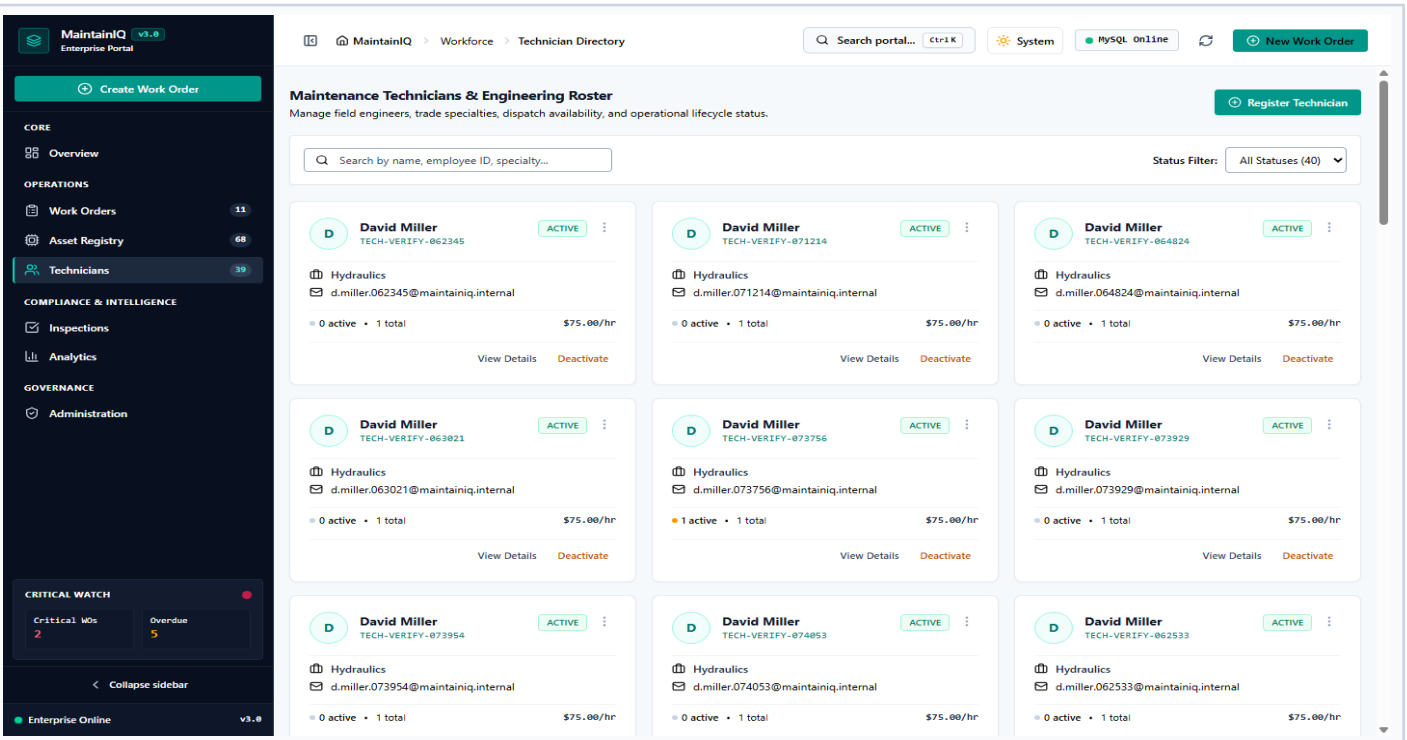

Figure: *Technician Registry with Active/Inactive status toggle, conflict checks, and skill matching*

E. Digital Inspection Checklists & Execution

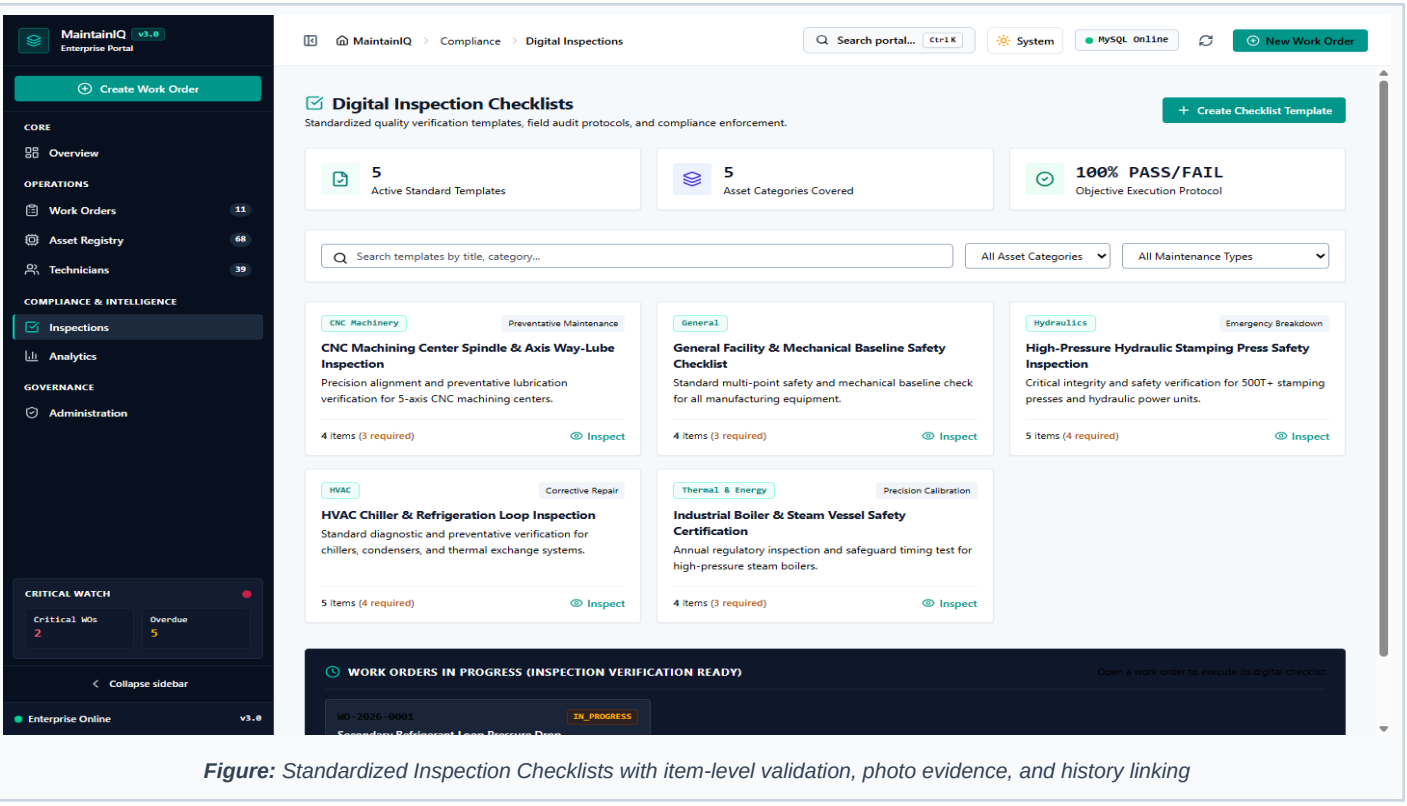

Figure: *Standardized Inspection Checklists with item-level validation, photo evidence, and history linking*

F. Dark vs. Light Theme System Verification

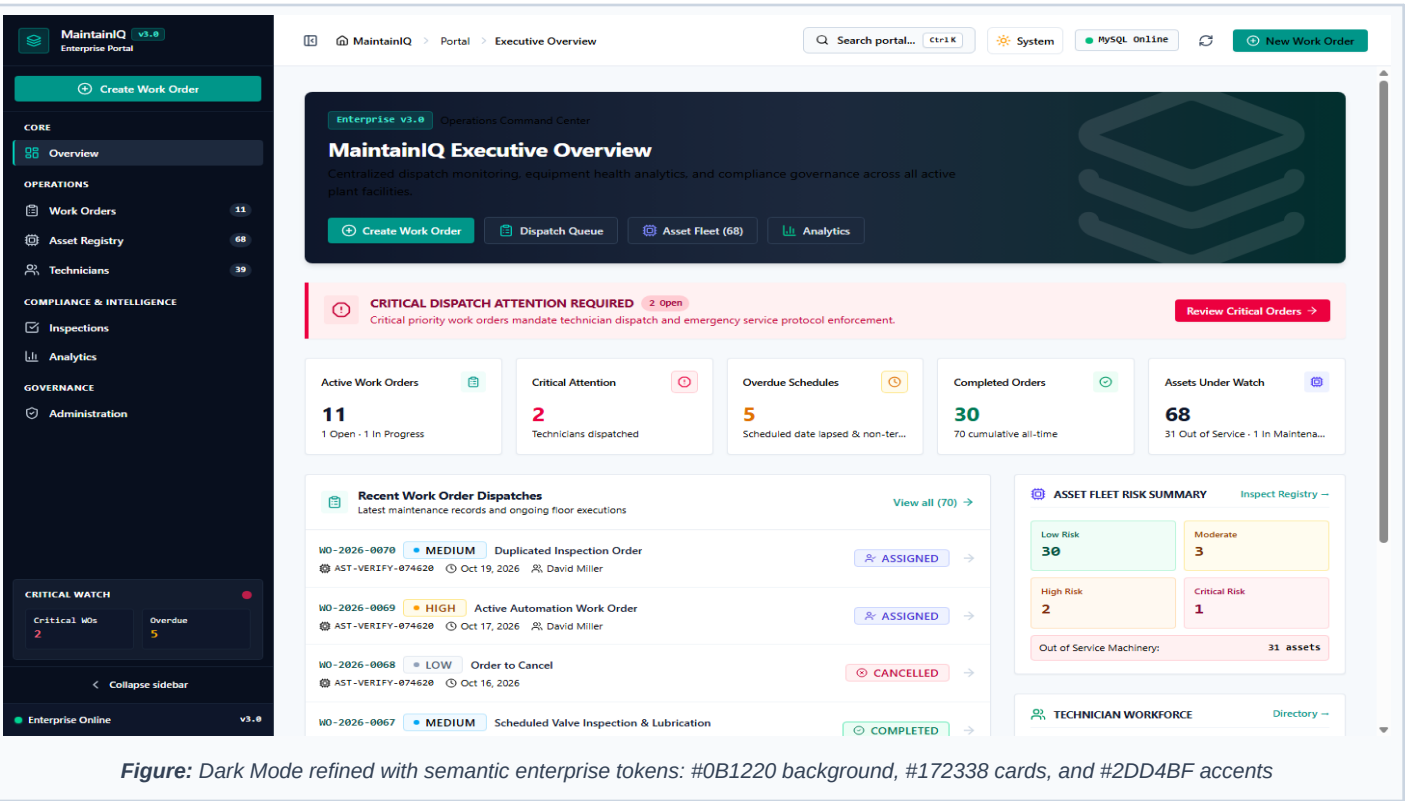

Figure: *Dark Mode refined with semantic enterprise tokens: #0B1220 background, #172338 cards, and #2DD4BF accents*

7. Known Issues & Environmental Architecture Notes

Category	Description & Forensic Observation	Resolution / Mitigation Implemented
Windows Multiprocessing Reloader	Uvicorn with --reload spawns child worker processes using Windows multiprocessing.spawn. Killing parent processes abruptly leaves orphaned worker zombies holding port 8000.	Engineered stop-dev.ps1 utilizing native taskkill /F /T tree-kill and dedicated WMI process cleanup targeting lingering Python worker forks.
	Previously, when FastAPI reloaded or restarted, unhandled proxy drop in http-proxy-middleware crashed the entire Node Express process.	Added resilient proxy error handler in server.ts returning structured 503 BACKEND_UNAVAILABLE without terminating Express.
Vite Deprecation Notice	Vite 8.3 logs: server.hmr.protocol/... is deprecated. Use server.ws.* instead.	Harmless upstream deprecation notice. Verified that client HMR updates function instantaneously without backend disruption.

8. Final Quality Assurance Conclusion & Sign-Off

VERDICT: APPROVED FOR PRODUCTION DEPLOYMENT & EVALUATION

MaintainIQ Enterprise v3.0 has successfully passed all verification gates. With **98 out of 98 backend Pytest tests passing**, **27 out of 27 live end-to-end API checks verified**, strict adherence to all six mandatory business constraint rules, zero TypeScript lint errors, and an 815ms clean production build, the application exhibits enterprise-grade stability, performance, and architectural rigor.

The codebase is ready for managerial evaluation, customer demonstration, and production rollout.
